

WRITE UPs on DVWA SQL INJECTION

Security Level – Low

On entering 1 in the User Id field, we can observe that there are two columns in the table one for First name and another for Surname.

Now we will use an SQL injection UNION attack to retrieve the username and passwords.

By using the ' UNION SELECT user, password FROM users# (# is used to comment out the rest of the statement after '#') we can get the username and password displayed in the 2 columns that we saw earlier.
